CHRONOFIELD · PRE-SEED · JULY 2026

# 225 AV1 comparisons.
# 225 compression wins.

Current CFT11: −41.37% bytes · 8.42× encode · 4.98× decode.
Every compared source reconstructs exactly.

# Exact video economics compound at two layers

## CODEC LAYER

Strict-lossless video can reduce bytes, but aggressive settings often demand substantial encode time.

That trade-off limits when compression is economically useful.

## STORAGE LAYER

Masters, renditions and related versions are commonly stored as independent physical objects.

Cross-version structure is paid for repeatedly.

**ChronoField attacks both: exact encoding efficiency and physical duplication across related video.**

# One stack, three deployment profiles

### CFT REALTIME

## Fast exact encoding

Targets online or high-throughput workflows where encode latency matters.

### CFT ARCHIVE

## Maximum byte reduction

Trades more encode time for cold storage and high-value archival workloads.

### CFMS

## Cross-rendition storage

Removes physical duplication across related resolutions, versions and videos.

# Current CFT11 wins size, encode and decode

**−41.37%**

**fewer bytes**

Aggregate CFT11 fast versus AV1 cpu-used=4.

**8.42×**

**faster encode**

Same source frames, hardware and strict-lossless target.

**4.98×**

**faster decode**

Every output matched the canonical RGB SHA-256.

**Three real 1080p sources · exact RGB24 · simultaneous aggregate win vs AV1 cpu-used=4**

# The AV1 result repeated across the development program

**225/225**

**AV1 size wins**

Recorded head-to-head comparison outcomes. No tie. No loss.

**33**

**benchmark suites**

Multiple real-video classes, resolutions, profiles and codec generations.

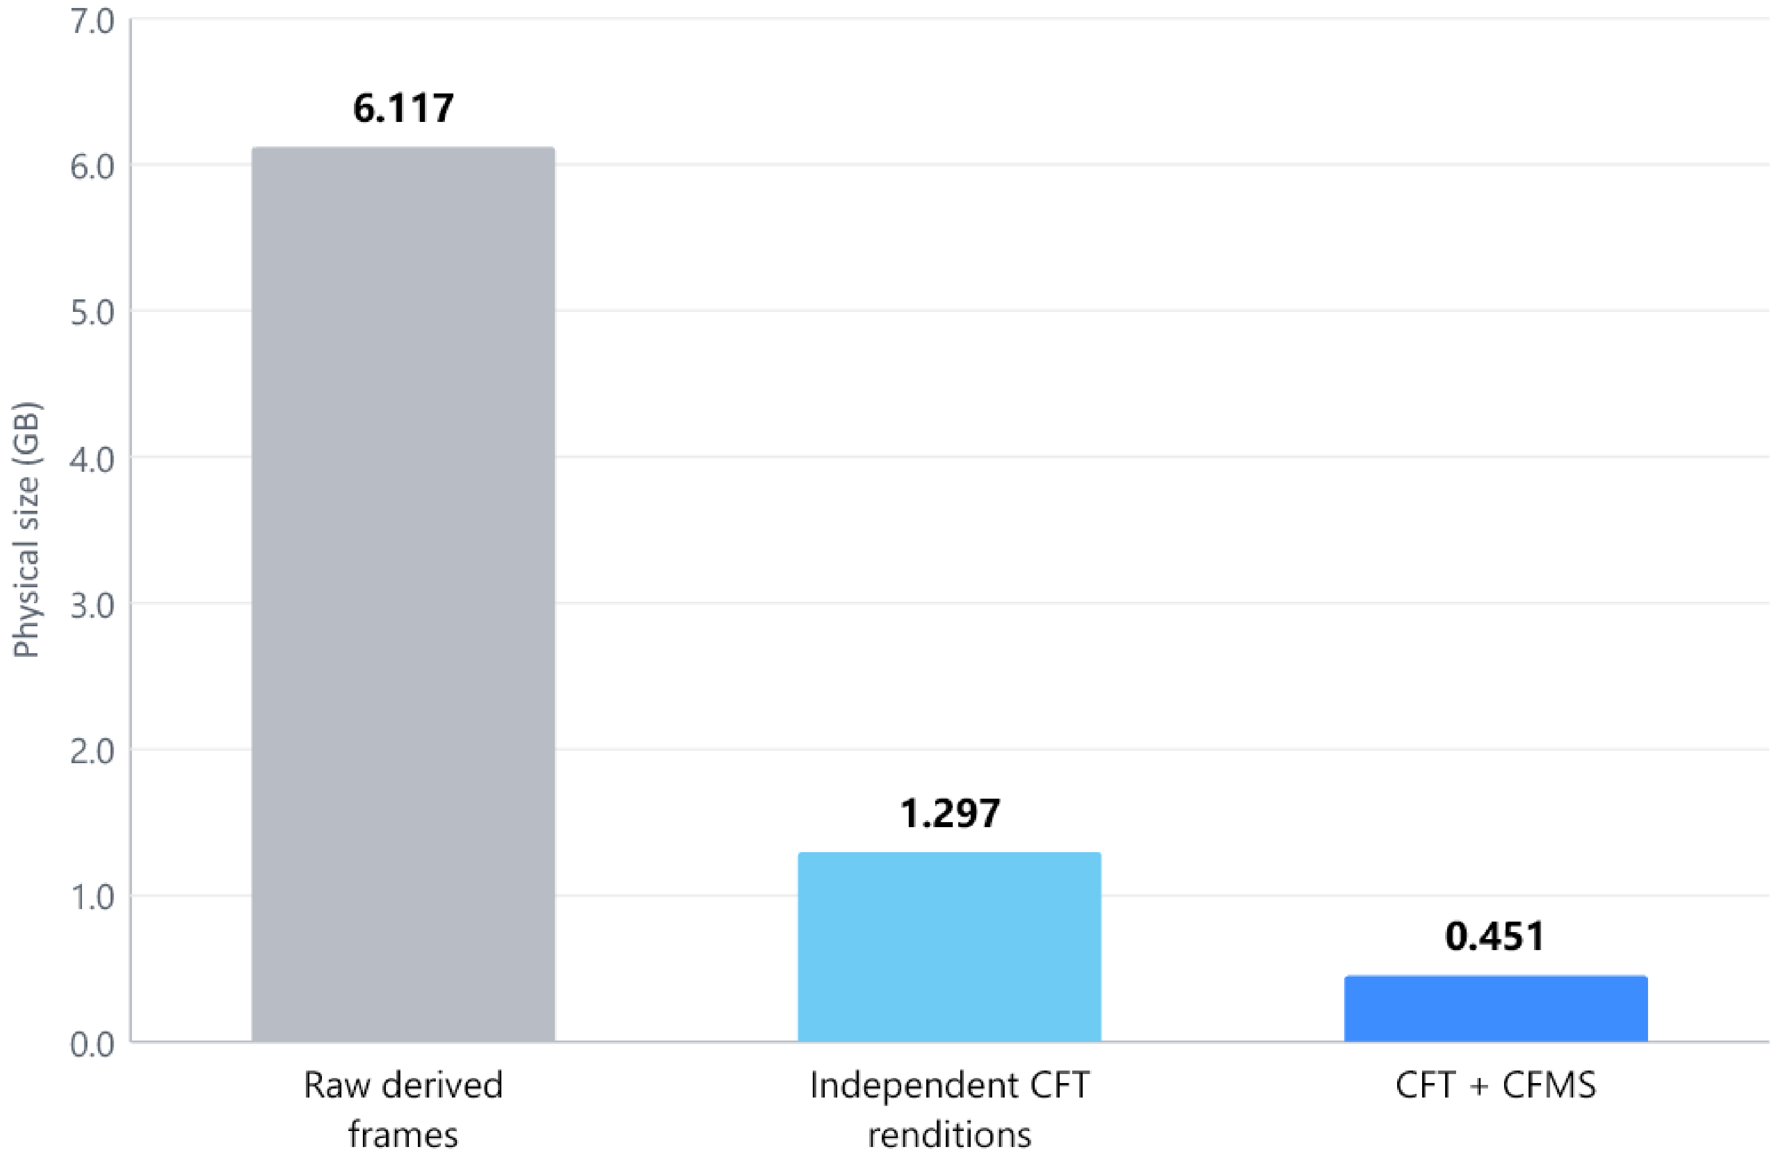
**512**

**release tests**

Current native 0.27.0 release, packaged wheel and exact gates.

**Peak completed Full-HD points: 55.25% fewer bytes and 29.39× faster encoding than the measured AV1 baseline.**

# CFMS cut a multiresolution family to 0.451 GB



**−92.625%**

vs raw derived frames

**−65.2067%**

vs independent CFT renditions

**840 exact frames**

cold-tier multiresolution run

# The benchmark package is ready for controlled reproduction

## PROVEN IN-HOUSE

- 225 recorded AV1 size wins
- Current CFT11 native release 0.27.0
- Exact RGB SHA-256 outputs
- Long 720p and 4K gates
- 512-test regression suite

## OPENING NOW

- Frozen release artifact and SHA-256
- Third-party-selected corpus
- Independent hardware and flags
- Size, encode, decode and memory
- Signed result and failure log

# Start where exact bytes have an obvious price

MEDIA ARCHIVES

**Large exact masters and long retention**

License + usage

VIDEO INFRASTRUCTURE

**Offline, mezzanine and lossless workflows**

SDK / API

AI DATASETS

**Repeated video corpora and derived versions**

Storage engine

REGULATED WORKFLOWS

**Exact reconstruction and auditable outputs**

Enterprise deployment

**First wedge: paid blind benchmarks and narrow design-partner deployments.**

# The moat has to survive blind testing, not marketing

| APPROACH | PRIMARY STRENGTH | CURRENT STATUS |
|---|---|---|
| Measured strict-lossless AV1 | Open, mature baseline | Reference competitor |
| General-purpose compression | Broad applicability | Not video-native |
| **CFT realtime** | Exact + throughput profile | Internally measured |
| **CFT archive** | Exact + size profile | Internally measured |
| **CFMS** | Cross-rendition physical reuse | Internally measured |

Every size, speed and exactness claim is structured for independent audit.

# A three-step route from benchmark to deployment

**0–8 WEEKS**

### Blind validation

Third-party corpora,
exactness and reproducibility

**2–5 MONTHS**

### Design partners

Paid evaluations in
storage and media workflows

**5–12 MONTHS**

### Narrow production

SDK/API deployment,
commercial terms and scale

**Disclosure expands only after mutual fit, protocol agreement and legal review.**

# One founder built the codec, storage layer and validation stack

## Designed and implemented CFT, CFMS, benchmark harnesses and exactness tests independently.

Solo ownership compresses the loop from idea to implementation to exact benchmark. Successive releases turned rapid experimentation into 225 recorded AV1 size wins.

**COMPANY SETUP**

Current base
Moscow

Planned
Relocation + compliant international entity

Condition
KYC and specialist sanctions counsel before investment

**Immediate hires: codec/systems engineer, independent benchmark partner and commercial lead/adviser.**

THE ROUND

# $250k–$500k pre-seed

$50k–$100k first close possible

**Alternative first transaction: funded blind validation or a paid pilot.**

### CAPITAL UNLOCKS

- Independent blind benchmark
- Reproducible Linux/server build
- Third-party corpus expansion
- IP, company and FTO work
- Two design-partner evaluations
